SUMMARY

Associate Software Developer and Computer Science graduate (May 2026) working across embedded firmware, hardware, infrastructure, and full-stack web. At Putt Quest, builds course lighting and moving obstacles end to end, from mechanism design, wiring, and installation through C++ firmware, and provisioned the location's self-hosted Kubernetes cluster. Founder of TickerStats, an AI-powered equity research SaaS.

EDUCATION

Truman State University **Kirksville, MO**

BS in Computer Science (May 2026)

- Organizations/Awards: President's Scholarship Recipient, Hackathon Winner (PickHACK, TigerHacks, TruHacks), TruScholars, Bulldog Student Investment Fund (VP of Alumni Relations), and Google Developers Student Club.
- RELEVANT COURSEWORK: Data Structures & Algorithms, Database Systems, Artificial Intelligence, Computer Architecture, Software Engineering, Computer Security, Operating Systems, Linear Algebra

SKILLS

Languages: TypeScript, Python, C++, SQL
Web: React, Next.js, SvelteKit, FastAPI, NestJS, Expo, Tailwind CSS, PostgreSQL, Auth0, Stripe, Zod
Embedded & Hardware: ESP32-C6/S3, ESP-IDF, ESPHome, PlatformIO, Matter-over-Thread, MQTT, OTA updates, soldering, power distribution, 3D printing
Infrastructure: Kubernetes (k3s), Ansible, ArgoCD, Longhorn, Docker, Cloudflare Tunnel, Git/GitHub

WORK EXPERIENCE

Putt Quest (Premiere Mini Golf LLC) **Fairview Heights, IL**

Associate Software Developer (full-time from Sep 2026; part-time May–Aug) *May 2026 – Present*

- Designed and built LED Orchestra, an offline LED show controller in C++ (ESP-IDF, ESP-Matter) in which ESP32-C6 nodes render one synchronized virtual strip over a Matter-over-Thread mesh; selected the controller/Thread Border Router topology through on-hardware validation and added OTA firmware updates.
- Ported its pixel-effect engine into the production ESPHome/MQTT lighting firmware, and wired, soldered, powered, and installed 6,400+ WS2815 LEDs (700+ ft) across 18 holes on ESP32-S3 controllers.
- Designed and built a motorized fish-jaw obstacle: a hinged lower jaw driven by a 12 V linear actuator with a magnetic breakaway, 3D-printed on a Bambu Lab printer, plus ESP32-C6 firmware (C++, PlatformIO) with a Wi-Fi control page, OTA updates, fault states, and 44 unit tests.
- Assembled and provisioned the location's 3-node high-availability k3s cluster on Raspberry Pi 5s, now running in production: flashed NVMe boot drives and ran Ansible playbooks deploying Longhorn storage, cert-manager, ArgoCD GitOps, Cloudflare Tunnel, and Kanidm identity.
- Built employee-portal scheduling features (SvelteKit, TypeScript, PostgreSQL): transactional schedule saves, per-location permission checks, DST-safe shift reminders, and directory sync that deactivates departed staff.

Office of Student Research, Truman State University **Kirksville, MO**

TruScholars Summer Undergraduate Research Program *May 2024 – July 2024*

- Collected, cleaned, and annotated 500+ imagery samples; trained and evaluated a YOLOv8 model for litter and illegal dumping detection and deployed a Streamlit inference app with image/video/webcam support.

PROJECTS

TickerStats | AI-Powered Equity Research SaaS | React, TypeScript, FastAPI, PostgreSQL, Auth0, Stripe | GitHub

- Founded and built an AI-powered equity research SaaS for investment fund workflows, comparing up to 100 tickers across fundamentals and performance metrics, with DCF valuation.
- Generated pitch decks with consistent thesis, risk, and valuation sections from structured LLM outputs with schema validation, and exported results to CSV/XLSX/PDF/PPTX.
- Enforced Free vs. Pro tiers with Auth0 JWT claims, Stripe subscriptions, and race-safe usage limits in PostgreSQL.

BizAQ | AI-Assisted Business Acquisition Search | Python, LLM Agents, Census Data | GitHub

- Built an AI-assisted search across business marketplaces, brokers, and public records in six states, capturing 373 listings and 19 off-market leads and advancing 6 businesses to full analysis, including site visits and seller negotiations.
- Researched each store's market using demographics, traffic counts, nearby competitors, gaming revenue, and license and ownership records, then placed every store on a market-attractiveness vs. competitive-position grid linked to a one-page brief on affordability, legality, and major costs.

GapWalk | Mobile App | Expo (React Native), TypeScript, NestJS, Firebase, PostgreSQL, Redis | **GitHub** | PlayStore

- Architected the NestJS backend for a published Android app that finds free gaps in a user's Google Calendar and nudges them toward short walks, using PostgreSQL, Redis, and Firebase authentication.
- Built background job workers handling push notification delivery and schedule analysis, keeping app state synchronized across devices.
